# Confidentiality

Cryptology

Encryption

Cryptanalysis  
(breaking cipher)

## Formality

P = plaintext → data format

C = Cryptic text = ciphertext → some data format

E = Encryptor and decryption

D = Decryption =  $D(E(P)) = P$

So E and D are mutually converse to each other

Principle = Common Partners {Alice, Bob}  
 Intruder = Unauthorized person = {Trudy}

Active: Attacker

## TRADITIONAL MODEL FOR CRYPTOGRAPHY

# CLASSICAL ENCRYPTION ALGORITHM

2

## I K-shift Method or Caesar Method

Ex: ① K=3

P = BAL

⇒ C = EDG

② C = L D P D E R B

P = ~~I B N B B B X~~

P = I A M A B O Y

## Approach of Cryptanalyst

Monograms = { I, a, ... }

Digrams = { am, an, at, as, I --- }

Monograms will give clue to digrams  
Digrams will give clue to Trigrams  
and so on.

Here

C = L D P D E R B

k c o c d z a

P = I a m a B o y

## II

## Substitution Algorithms

### a) Monoalphabetic Substitution Algorithm

Ex Mapping Table

a	s
b	u
c	y
d	a
e	m

P = BAD

C = USA

(GOALS)

Even though the plaintext & key lengths are equal, the ciphertext length should not be expected to be the same as the world of network security for the purpose of confidentiality of key is not important.

# b) Polyalphabetic Substitution cipher (Vigenere Method)

a	b	c	d	e		x
b	c	d	e	f	-	xa
s	t	u	v	w	(k)	
z	a	b	c	d	e	xy

26x26

eg:

1. If the crypt

corresponding to the plaintext, the column of the key is taken as is used as ciphertext.

(col) Key = R G = (E)

(row) P = S S = (S)

Even though the ciphertext letters are repeated the plaintext letters may not be repeated.

# III TRANSPOSITIONAL METHOD

Plaintext

WE ARE DISCUSSING NWS  
ROOM NO # 404

Key = M E G A B U C K  
= 7 4 5 1 2 3 6

(By substituting as is)

M	E	G	A	B	U	C	K
7	4	5	1	2	3	6	
W	E	A	R	E	D		
S	C	U	S	S	I	N	G
N	K	S	I	N	R	O	O
M	N	O	#	4	0	4	

key size / No. of char. received (No. of full rows)

C = R S I # E S N 4 I N C 4 E C W N A I  
S G C K I S N M D I R O

No. of char. received = 31

$$\begin{array}{r} 3 \\ 8 \overline{) 31} \\ \underline{24} \\ 7 \end{array}$$

so there is 3 full rows and  
other row of 7 letters

The session key between the sender and receiver

$$g^{xy} \bmod n = 3^{10 \times 8} \bmod 47$$

$$= 3^{80} \bmod 47$$

$$= 4$$

4. The total number of keys required for a set of individuals to be able to communicate with each other using secret key and public key cryptosystems respectively are.

If 4 individuals

in private key crypto

	1	2	3	4
1	x	✓	✓	✓
2	x	x	✓	✓
3	x	x	x	✓
4	x	x	x	x

Here, 6 key required

$$\text{i.e., } \frac{n(n-1)}{2}$$

for public key cryptosystem

$$\text{(Ans) } n(n-1)/2 \text{ and } 2n$$

Ripple's Diffie-Hellman key exchange alg. is used. The sender sends (719, 3, 191) and the receiver responds with 543. If the receiver's secret key is 15, then calculate the session key.

$$n = 719$$

$$g = 3$$

$$3^x \bmod 719 = 191$$

$$3^y \bmod 719 = 543$$

$$\text{Session key} = (191)^{16} \bmod 543$$

$$= 40$$

12/11/10  
FRIDAY

## DATA ENCRYPTION STANDARD (DES)

- ✓ Designed @ IBM
  - ✓ Based on monoalphabetic s.c. (never failed)
  - ✓ Attack = Leslie
  - ✓ Proof = 'fiestaf'
  - ✓ Input = 64 bit = block (plaintext)
  - ✓ Output = 64 bit = ciphertext
  - ✓ Key = 56 bit
  - ✓ Total = 19 stages
  - ✓ In that 16 stages are key dependent and iterative in nature
  - ✓ 3 stages are key independent
- { 16 + 3 = 19 }

## KEY MANAGEMENT

### DIFFIE-HELLMAN KEY EXCHANGE ALGORITHM (DH ALG)

$x$  = Secret key Sender

$y$  = Secret key of Receiver

$g^{xy} \bmod n$  = Session Key

Good Candidate

Choose 'N' such a way that prime numbers

$N$  and  $(\frac{N-1}{2})$  both

Eg:  $N=7$

$$\frac{(N-1)}{2} = \frac{(7-1)}{2} = 3$$

②  $N=47$

$$\frac{(N-1)}{2} = \frac{46}{2} = 23$$

### FAST EXPONENTIAL MODULAR ARITHMETIC

$M^e \bmod n$

$e$  = exponent in binary

Initially  $d=1$

until  $e$ 's bits exhausted

$$d = (d \times d) \bmod n$$

$$\text{if } (b_i = 1)$$

$$d = (d \times M) \bmod n$$

eg: ①  $3^8 \bmod 47$

$e=8$

1	0	0	0
①	⑨	③④	②⑧
③	x	x	x

$d=1$

$= 18$

②

$543^{16} \bmod 719$

$e=16$

1	0	0	0	0
①	⑤⑨	⑥⑤⑤	⑤④	④⑥
③④③	x	x	x	x

$d=15$

1	1
①	①
①⑨	④①

③

$3^{10} \bmod 47$

$e=10$

1	0	1	0
①	⑨	③④	①⑦
③	x	⑧	x

$d=1$

④

$17^8 \bmod 47$

$e=8$

1	0	0	0
①	③	②	④
①⑦	x	x	x

$d=1$

ATTACK ON DH ALGORITHM

Man in the middle Attack (or)

Problems

Bucket Brigade Attack

Which of the following is a good candidate for n in Diffie-Hellman protocol

- A) 1 B) 33 C) 37 D) 47

A)  $N=7$

$$\frac{(N-1)}{2} = \frac{6}{2} = 3 \text{ (prime)} \quad \checkmark$$

B)  $N=33$

$$\frac{(N-1)}{2} = \frac{32}{2} = 16 \text{ (not prime)} \quad \times$$

C)  $N=37$

$$\frac{(N-1)}{2} = \frac{36}{2} = 18 \quad \times$$

D)  $N=47$

$$\frac{(N-1)}{2} = \frac{46}{2} = 23 \quad \checkmark$$

The Diffie-Hellman key-exchange is being used to establish a session key between the sender and the receiver with the values of  $g=7$  and  $p=23$

a) If the sender's secret key is  $x=3$  then it transmits the msg (23, ?)

$$g^x \text{ mod } n = 7^3 \text{ mod } 23$$

$$= 21$$

b) Receiver's secret key  $y=15$  and if it responds with the message ( ) fill the blank.

$$g^y \bmod n = 5^3 \bmod 23$$

$$= 125 \bmod 23$$

c) What is the session key between the sender and the receiver?

$$g^{xy} \bmod n = 7^{15 \times 3} \bmod 23$$

$$7^{15} \bmod 23$$

1	1	1	1
(1)	(3)	(4)	(2)
(7)	(21)	(5)	(14)

Ans = 14

3. The Diffie Helman key exchange is being used to establish a session key between the sender and the receiver with the values of  $n=47$ ,  $g=3$

a) If the sender's secret key is  $x=8$  then it transmits the msg (47, 3, ) fill in the blank

$$3^8 \bmod 47$$

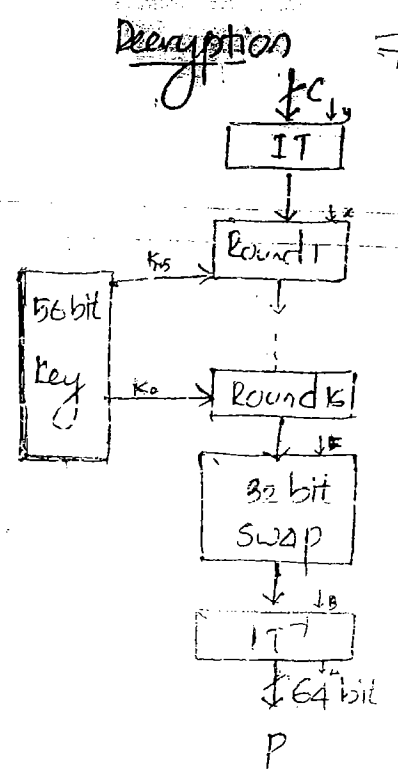

$$= 28$$

1	0	0	0
(1)	(9)	(21)	(8)
(3)	x	x	x

b) Receiver's secret key  $y=10$  and if it responds with the msg ( ) fill the blank

$$g^y \bmod n = 3^{10} \bmod 47$$

$$= 17$$

IT

0	1	2	3	4	5	6	7
1	0	3	2	5	4	7	6

$IT^{-1}$

0	1	2	3	4	5	6	7
1	0	3	2	5	4	7	6

It is a symmetry

# Subkey Generation

f(R)

If no. of 1's is odd +  
If " " " " is even +

Expand

$$8 \times 4 = 32 \rightarrow 8 \times 6 = 48$$

S-Box

7	0
8	0
9	0
A	10
B	11
C	12
D	13
E	14
F	15

Input is 0000  
 110000  
 [ ]

Here  $AF = 10$

$BCDE = 1000$  is 8

so output of S-box is  $A = 1010$

Fiestel proof

$$IT(A) = B$$

$$A = IT^{-1}(B)$$

$$IT^{-1}(x) = y$$

$$x = IT(y)$$

Keying

Encryption  $\rightarrow K_0$  to  $K_{15}$

Decryption  $\rightarrow K_{15}$  to  $K_0$

Note

$$* D(E(P)) = P$$

$$* E(D(P)) = P$$

TRIPLE DES

Encryption with 3 keys

128 bit

\* For IDEA has come with 128 bit key only

\* So now-a-days Triple DES with 3 keys

128 bits

Sender

$$D_{K_1} E_{K_2} D_{K_1} (C)$$

$$\rightarrow D_{K_1} (E_{K_2} (D_{K_1} (E_{K_1} (D_{K_2} (E_{K_1} (P))))))$$

### Modes

1) Electronic Code Book Mode

### Leslie Attack - Cipher Block Chaining

\* Manipulation is done on ciphertext and got financially benefited  
 Goal: Even though the plaintext characters are repeated the ciphertext characters should not be repeated

Encryption

Decryption

\* Error causes its impact on two blocks only [1<sup>st</sup> and 2<sup>nd</sup> block]

\* Bit timing error causes its impact on all subsequent blocks [1<sup>st</sup> block error]

Advantages \* Cipher block feedback mode

Used when the input size is less than block size

Encryption

Decryption

- \* Only [E] box in sender and receiver
- \* left shift register (LSR) is used by both sender and receiver
- \* Both LSR should be synchronised.
- \* Bit error causes its impact on two by only (ie.  $i^{th}$  and  $i+8^{th}$ )
- \* Bit timing error causes its impact on all subsequent bytes
- \* feedback is required for not to have Leslie attack.

#### 4. Output feedback mode

- \* Let  $i^{th}$  byte error should not cause its impact on subsequent bytes, so the feedback is considered from the o/p end

This mode is not robust ~~decry~~ cryptanalysis can easily break this. Since it works on the cyclic data.

## 5. Stream Cipher

where the key is continuous (but stream), then selector is not required. well in advance the third piece of data must have encrypted and readily available from the previous.

Encryption

Decryption

## 6. Counter Mode

→ Now a days, the database data is encrypted using the stream cipher.

→ Not to depend on the preceding record Cto decrypt the individual (second) counter is attached. The counter will be all NO SSN DAN CardNo or any Unique identifiers

Modes is practice real world

input

[diagram in booklet]

Large size

block size

chaining is used (ii)

feedback is used (iii)

SATURDAY

## PUBLIC KEY CRYPTOGRAPHY

Asymmetric Key Alg

Two keys

One key = Encryption = public key ( $K_u$ )  
Other key = Decryption = private key ( $K_r$ )

Requirement :

1. Encryption and decryption are diff. The above conclusion is possible just because both keys are originated by the same end.

$$D_{K_r}(E_{K_u}(P)) = P$$

\* One cannot guess ( $K_r$ ) from  $K_u$  public key ( $E_{K_u}$ )

\*

$$E_{K_{UB}}(P) = C$$

## RSA ALGORITHM (Rivest - Shamir - Adleman)

1. choose two large primes  $p$  &  $q$
2. Compute  $n = p \times q$  and  $\phi = (p-1) \times (q-1)$
3. Choose  $e$  such that  $e$  is relatively prime to  $\phi$  and call it  $e$
4. find  $d$  such that  $ed \equiv 1 \pmod{\phi}$

$$ed \pmod{\phi} = 1$$

Encryption

$$K_U = \{e, n\}$$

$$P^e \pmod{n} = C$$

Decryption

$$K_D = \{d, n\}$$

$$C^d \pmod{n} = P$$

Eg.

$$(1) \quad p = 3 \quad q = 11$$

$$(2) \quad n = 3 \times 11 = 33$$

$$(3) \quad \phi = 2 \times 10 = 20$$

$$(4) \quad e = 7 \quad (e, \phi) = 1$$

Say:

$$(4) \quad (e \times 7) \pmod{20} = 1$$

$$21 \pmod{20} = 1$$

$$e \times 7 \pmod{20} = 1$$

$$e = 21/7 = 3$$

Ans Both are true.

3 The minimum prime integer  $p$  such that  $3p \bmod 17$

Soln

$$3^5 \bmod 17 = 5$$

$$3^8 \bmod 17 = 16$$

$$3^{12} \bmod 17 = \text{Calculator out of bound}$$

$$\text{So } m=3, e=12, n=17$$

4. MD5 hash alg create 256 bit msg digest out of a msg. of 512 bit blocks. It has message digest of 128 bit

5. Diffie Helman key exchange is being used to establish a session key b/w the sender of the receiver with the values of  $n=23, g=7$

(a) If the sender's secret key is  $x=3$  then it transmits the msg  $(23, 7, \text{---})$  fill in the blank.

$$7^3 \bmod 23 = 21$$

(b) Receiver's secret key  $y=6$ . He responds with the msg  $\text{---}$

$$7^6 \bmod 23 = 4$$

(c) What is the session key b/w sender of the receiver

$$g^{xy} \bmod 23 = 7^{6 \times 3} \bmod 23$$

$$M=7, e=18, n=23$$

$$= 18$$

$$e=18$$

$$d=1$$

1	0	0	1	0
1	3	9	12	18
7	x	x	15	x

is a SLC

## QUESTIONS

- Suppose that two parties A & B wish to set a common secret key b/w themselves using Diffie-Hellman key exchange tech. They agree on  $p$  as the modulus and  $g$  as the primitive root. Party A chooses 2 and party B chooses 5 as their respective secrets. Their D-H key is:-

$$p=7, \quad g=3, \quad x=2, \quad y=5$$

$$A = g^x \text{ mod } p = 3^2 \text{ mod } 7 = 2$$

- Consider the following statement

(i) A function  $f$  is called a permutation if it maps each element of its input alphabet to a unique element of its output alphabet. In other words,  $f$  performs a permutation on the elements of its input alphabet.

Ans

Injective function - means only one function has only one mapping. No NA function can map to one.

6. The RSA Alg. is used by choosing two prime no.  
 say  $p=7$  &  $q=17$  If the public key is  $e=5$  then

- ① What is the value of  $d$ ?
- ② What is the cipher value to transmit the character 'F'?

③

①

$x_1$	$x_2$	$x_3$
1	0	96
0	1	5

$y_1$	$y_2$	$y_3$
0	1	5
1	-19	1

$$\phi = [x_3/y_3]$$

$$\phi = 41$$

$$96 + 19 = \underline{\underline{77}}$$

②

$$p = 6$$

$$p^e \bmod n = 6^5 \bmod (7 \times 17) = \underline{\underline{41}}$$

7

RSA alg is used with prime no: 397 & 401 to generate public keys & private keys.

- ① If the  $e$  is chosen as 343 then calcu 'd' value

$$343 \bmod 1608 = 343$$

$$(343d)$$

$$(343d)$$

$x_1$	$x_2$	$x_3$
1	0	158400
0	1	343

$y_1$	$y_2$	$y_3$
0	1	343
1	-46	277

1	-461	277
1	462	66

1	462	66
5	-2309	13
-26	12007	1

$$158400$$

$$[x_3/y_3]$$

$$461$$

$$1$$

$$4$$

$$5$$

$$\underline{\underline{d = 12007}}$$

(9) The sender's private key is 19. The sender sends  $(7, 3, 13 \bmod 23)$ . And the receiver responds with  $(76 \bmod 23)$ . Then calculate the session key.

$$7^{18 \bmod 23} \cdot ((76 \bmod 23)(19 \bmod 23)) \bmod 23$$

Ans - 18

(10)  $a=18$   
 $d=1$

1	0	0	10	
1	3	9	12	18
7	x	x	15	x

(9) SHA1 hash algorithm creates an n bit digest out of a msg of 512 bit blocks. It has a msg digest of 5 blocks of 32 bits.

$$5 \times 32 = 160$$

(10) Which of the following statements are true pertaining to the characteristics of digital signature

- The receiver can verify the claim.
- The sender cannot tamper with the contents of the msg.
- The receiver cannot possibly have concocted the msg. himself.

Ans: I, II & III

(11) Diffie-Hellman key exchange. The sender sends  $(19, 3, 19)$  and the receiver responds with 543. If the receiver's secret key is 18, calculate the session key.

Observation

SHA-512

O/P = 512 bits

I/P = 1024 bits

Observation

1. We do encryption first then 2.

1000 - [E] - 1000 - [zip] - 100

2. If we are doing signature encryption

1000 - [zip] - 100 - [E] - 100

Second is fast because only 100 bits are need to encrypt

A system identified by the firewall administrator as a critical, strong point in the network's security.

The bastion host services as a platform for an application level or circuit level gateway.

#### Firewall Configurations

##### ① Screened host firewall, single home bastion config

##### ② Screened host firewall dual homed bastion host

## Fragment Attack

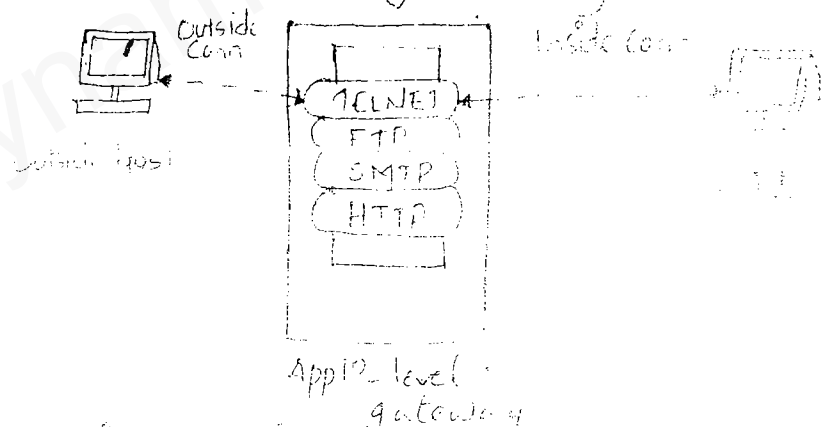

Data that are sent to the destination are sent by a lot of fragments

## Firewall characteristics

### Design goals

- \* All traffic from inside to outside (or pass through the firewall (or possibly blocking all access to local chip sets via the firewall))
- \* Only authorized traffic (as per local security policy) will be allowed to
- \* The firewall itself is immune to penetration (use of trusted software to secure OS)

## ② Application-level gateway

## ③ Circuit level gateway

Circuit level gateways CGW	Packet filter or Screening Router (PF) Network	Application Gateway (AGW) Application	Base CG A Capo
Physical			

## ① Packet filtering Routers

Possible Attack and appropriate Countermeasure

### Interview Questions

- ✓ SNIFFING
- ✓ SNOODING
- ✓ SNOOFING
- ✓ PHISHING

~~Sniffing~~

### Possible Attack PHARMING

#### ① IP Address - Spoofing

Attacker declares inside n/w's IP address and enter the premises.

#### ② Source Routing Attack

$A \rightarrow R \rightarrow B$  = Strict Source Routing  
Loose Source routing

In order to faster the routing packet switching use strict source routing (ie clear scale should be provided)

In the RSA Alg. the private and public keys are  $(d, n)$  and  $(e, n)$  respectively, where  $n = p \times q$  and  $p$  and  $q$  are large prime numbers.  $p$  and  $q$  are public. Let  $m$  be an integer such that  $\gcd(m, n) = 1$ .

$$\phi(n) = (p-1)(q-1)$$

Now consider the following statements:

i)  $m' = m^e \bmod n$

$$M = (m')^d \bmod n$$

ii)  $ed = 1 \bmod n$

iii)  $ed = 1 \bmod \phi(n)$

iv)  $m' \neq m^e \bmod \phi(n)$

$$M = (m')^d \bmod \phi(n)$$

- (a) I and II    (b) I and III    (c) I and IV    (d) III and IV

Ans (b)

$$p^e \bmod n = c$$

$$c^d \bmod n = p$$

$$\text{Given } m^e \bmod n = m'$$

Firewalls

Bad In / Bad Out : stopped

Types

- ✓ Circuit level Gateway
- ✓ packet filtering router
- ✓ Application gateway
- ✓ Bastion host

# Extended Euclidean Algorithm

$x_1$	$x_2$	$x_3$	$y_1$	$y_2$	$y_3$
1	0	8	0	1	8

$$Q = \left\lfloor \frac{x_3}{y_3} \right\rfloor$$

$$A = L - Q \cdot R$$

eg (1)  $(ex 1) \bmod 360 = 1$

$x_1$	$x_2$	$x_3$	$y_1$	$y_2$	$y_3$
1	0	360	0	1	7
0	1	7	1	-51	3
			-2	103	1

$$Q = \left\lfloor \frac{x_3}{y_3} \right\rfloor$$

$$\left\lfloor \frac{360}{7} \right\rfloor = 51$$

$$\left\lfloor \frac{7}{3} \right\rfloor = 2$$

So Ans is e = 103

eg (2)  $(5 \times d) \bmod 96 = 1$

$x_1$	$x_2$	$x_3$	$y_1$	$y_2$	$y_3$	$Q = \left\lfloor \frac{x_3}{y_3} \right\rfloor$
1	0	96	0	1	5	19
			1	-19	1	

The Ans obtained is -ve so add it with  $y_2$

$$(-19 + 96) = 77$$

$$ed \bmod \phi = 1$$

$$(ex 27) \bmod 45 = 1$$

$$e = \underline{\underline{3}}$$

p	p <sup>e</sup> mod 55
a=1	1 <sup>3</sup> mod 55 = 1
b=2	2 <sup>3</sup> mod 55 = 8
c=3	3 <sup>3</sup> mod 55 = 27
d=4	4 <sup>3</sup> mod 55 = 34
e=5	5 <sup>3</sup> mod 55 = 5
f=6	6 <sup>3</sup> mod 55 = 36
g=7	7 <sup>3</sup> mod 55 = 17
h=8	8 <sup>3</sup> mod 55 = 37
i=9	9 <sup>3</sup> mod 55 = 14
j=10	10 <sup>3</sup> mod 55 = 10

### Problem 9

$$p=7, q=17, e=5$$

What is the VAC of d

$$\textcircled{1} p=7, q=17$$

$$\textcircled{2} n=119$$

$$\textcircled{3} \phi = 6 \times 16 = 96$$

$$\textcircled{4} \gcd(d, 96) = 1$$

$$\text{Given } e=5$$

$$ed \bmod \phi = 1$$

$$(5 \times d) \bmod 96 = 1$$

$$\Rightarrow (96 \times 4) + 1 \bmod 96 = 1$$

$$5 \times d = 385$$

$$d = \underline{\underline{77}}$$
